

Gemini configuration

A Streamlit-based resume analyzer that keeps the existing deterministic Week 1 scoring logic while adding a real Gemini API analysis layer for explainability, skill matching, and screening support. - Paste a job description - Upload one or more PDF resumes - Extract text from PDF files - Compare resumes against required and preferred job skills - Display match scores, matched and missing skills, and explainable insights - Use the Google Gemini API for structured screening analysis while preserving the existing scoring engine - Show an explicit AI screening disclaimer and bias-awareness guidance

1. Copy `.env.example` to `.env`.
2. Add your Gemini key: ````env GEMINI_API_KEY=your_actual_key_here GEMINI_MODEL=gemini-3.6-flash ```` Note: Google may retire older Gemini model IDs for new accounts. The app includes a fallback path, but the recommended model for newer accounts is `gemini-3.6-flash`.

Features

- Paste a job description
- Upload one or more PDF resumes
- Extract text from PDF files
- Compare resumes against required and preferred job skills
- Display match scores, matched and missing skills, and explainable insights
- Use the Google Gemini API for structured screening analysis while preserving the existing scoring engine
- Show an explicit AI screening disclaimer and bias-awareness guidance

Gemini / AI Integration

1. Copy `.env.example` to `.env`.
2. Add your Gemini key:
````env  
GEMINI_API_KEY=your_actual_key_here  
GEMINI_MODEL=gemini-3.6-flash  
````

Note: Google may retire older Gemini model IDs for new accounts. The app includes a fallback path, but the recommended model for newer accounts is `gemini-3.6-flash`.

3. The application uses `python-dotenv` and reads the key from the environment automatically, so the key is never hard-coded into source code.

Notes

- The deterministic Week 1 score remains the main assessment signal.
- The Gemini integration is used to produce a structured, job-focused explanation and guardrails around bias-sensitive screening.
- If the API key is missing or the API call fails, the app falls back to the deterministic scoring logic without exposing the API key in the UI.
- The application never evaluates protected characteristics such as age, gender, race, religion, nationality, disability, or other unrelated personal details.
